

TrackServ project structure and functionality:

1) Project overview and purpose

- What problem is TrackServ trying to solve?
- Why did you choose this project, and how is it useful to real users?
- How does your project differ from existing similar systems?
- Who are the main users of this application?

2) System design and architecture

- What is the overall architecture of the system?
- How are the frontend, backend, and database connected?
- Why did you choose React for the frontend?
- How do the admin dashboard and user-facing app communicate with each other?

3) Features and functionality

- Which features are the most important in your project?
- How does the reporting system work?
- How do users log in and register?
- What role does the admin dashboard play in the system?
- How are locations, assignments, and user profiles managed?

4) Database and data handling

- Which database did you use, and why?
- How is data stored and retrieved in the application?
- How do you ensure data consistency across different pages and modules?
- What happens if a user submits invalid or incomplete data?

5) Security and reliability

- How do you handle user authentication and authorization?
- What security measures are in place for user data?
- How do you prevent unauthorized access to admin functions?
- How do you handle errors and system failures?

6) Testing and quality assurance

- How did you test the application?
- What kind of bugs did you encounter during development?
- How do you verify that the UI works correctly?
- Did you perform any usability testing?

7) Challenges and decisions

- What was the biggest challenge you faced during development?
- Which part of the project took the longest to complete?
- What design decisions did you make that improved the project?
- What would you improve if you had more time?

8) Future improvements

- What enhancements would you add in the next version?
- How would you scale the project for more users?
- Would you consider adding mobile support?
- How would you integrate analytics or notifications?

9) Presentation and defense questions

- Can you explain why your project is a good IT solution?
- How does your project demonstrate software engineering principles?
- What skills did you develop while building this project?

- How would you present the project to a client or stakeholder?

Concise set, these are the most likely questions:

1. What is the main purpose of TrackServ?
2. What technologies did you use and why?
3. How does the admin dashboard work?
4. How is user authentication handled?
5. How are reports and assignments stored?
6. What were the biggest challenges in the project?
7. How did you test the application?
8. What would you improve next?
9. Why is this project relevant in real life?
10. How does your project show your technical skills?
